CamelCase

New wiki links are automatically created when concatenating capitalized words, such that for example the word 'Camel' and the word 'Case' concatenated form a link to this [CamelCase](#) page.

CamelCase is the original wiki convention for creating hyperlinks, with the additional requirement that the capitals are followed by a lower-case letter; hence "AlabamA" and "ABc" will not be links.

Customizing the Wiki behavior

While Trac remains faithful to the original Wiki style, it provides a number of ways to accommodate users with different preferences:

- To prevent the creation of a new link of a camel-cased word, prefix with an exclamation mark (`!`): `!CamelCase`.
- To ignore links to missing pages when the link is written using the [CamelCase](#) style, that word can instead be replaced by a gray link followed by a question mark. This is useful in cases when [CamelCase](#) style is used to name code artefacts like class names and there is no corresponding page for them. This option can be set in `ignore_missing_pages` in the [wiki] section of [TracIni](#).
- To automatically insert space characters between the words of a [CamelCase](#) link when rendering the link, use `split_page_names` in the [wiki] section of [TracIni](#).
- Creation of explicit Wiki links is also easy, see [WikiPageNames](#) for details.
- Wiki formatting can be disabled completely in some places, for example when rendering commit log messages. See `wiki_format_messages` in the [changeset] section of [TracIni](#).

See [TracIni](#) for more information on the available options.
